

NM 313 and Roy Avenue

Albuquerque, New Mexico

CobbFendley completed Quality Level B SUE services for this roadway design project. As part of CobbFendley's standard SUE Quality Level B deliverable, we provided electronic depths of cover for each designated utility. Based on this additional information and the current design, it was determined that Level A test holes would not be required, resulting in a cost savings to the NMDOT.

CobbFendley has provided Subsurface Utility Engineering (SUE) services to NMDOT since 2007.

Additional NMDOT projects include:

- NM 185 (Valley Drive), Las Cruces, New Mexico
- NM 47 and NM 304, Belen, New Mexico
- NM 528, Rio Rancho, New Mexico
